lspci -v that's not going to do you any good lspci -v so I tried lspci -v I've told you 2 times, as you said that already okay so i ran lspci -v very good and what does that show? and it show that I have the nVidia Corporation NV30 [GeForce2 Ultra] but I have the nVidia Corporation NV43 [GeForce Go 7300] ok, that's fine show me "ip route" wait, i reboot the system spongebob58: now that's not going to help, as it will take a few minutes as it will have to build a new table of ip routing info I'm not aware of any firewall settings that can "gracefully" interrupt routing table updates, but you could do a net shutdown, wait 10 seconds and reboot, but that's a massive effort, not a graceful effort okay im back show me "ip route" please sorry, forgot to copy it great now, lets try to see what your host, hostname, and the "hosts" table look like okay, sorry, i couldnt find it so you're not running ubuntu yes, its a pure xubuntu install interesting, so your "host" table and "hosts" table are empty, and your host is "localhost" so I'd try a simple ping of "localhost" 82157476af
